

Lab-link software vendors take stock of tomorrow

What is the future of physician office-laboratory link software in an environment that is increasingly adopting electronic medical records and that continues to contend with system connectivity issues? CAP TODAY asked experts in the field for their opinions. Here's what they had to say.

CAP TODAY: Will widespread adoption of electronic medical record systems influence the use of physician office-laboratory linking software? If so, how must POLL software adapt to thrive?

❖ **Rob Atlas, CEO, Atlas Medical Software, Calabasas, Calif.:** Delivering lab results to electronic medical record systems is already a market requirement. Labs will soon need to take electronic orders from EMRs. POLL system vendors that have focused on the operational requirements of the lab will play an important role in this new paradigm.

Atlas

Electronic medical records typi-

cally offer users order entry workflow, though support for lab ordering varies widely and can fall far short of what is required by the typical lab outreach program. Successful POLL vendors will balance what each EMR vendor supports and what the lab needs using an open platform that employs a broad spectrum of integration options. The POLL system will function as a flexible business rules engine that sits between the EMR and the lab's internal enterprise systems to enhance the order from the EMR in whatever form it is presented. This engine will offer medical necessity verification, test catalog management, test sharing and routing, and a host of other supplemental functions on demand to meet the lab's needs.

❖ **Cory P. Fishkin, president and**

COO, CareEvolve.com, Elmwood Park, NJ: The short answer to this question is yes, widespread adoption of electronic medical record systems will influence the use of POLL software. However, the reality of it is that the reporting modules of most electronic medical record/electronic health record systems are notoriously weak. They are geared to office procedures, not laboratory results, especially with the increase in image-based and molecular testing.

Even as most EHRs try to strengthen their laboratory results reporting applications, they still have difficulty meeting the needs of the laboratory from an order entry

Fishkin

perspective. Many EHRs require an order prior to receiving a result. Standing orders, split requisitions for frozen sections, routing by payer, and ask-at-order-

entry questions are still challenges for most EHRs.

POLL software vendors continue to play a vital role by assisting EHR vendors in enhancing their applications for the benefit of the physician, lab, and patient. Interface engines enhance the ability of POLL vendors to provide connectivity to EHRs for orders and results. By using POLL vendors to interface to EHRs, rather than asking a laboratory information system or hospital information system vendor to interface, hospital labs can obtain an interface with a smaller commitment of time and money while improving their outreach capabilities. In addition, advancing data analytics functionality will allow POLL software to be a vital component in health care today and into the future.

❖ **Ravi Sharma, CEO, 4Medica, Culver City, Calif.:** POLLs prove that physicians will adopt a business model that uses an Internet model for delivery of clinical data.

CareEvolve™

The Leader in Outreach Connectivity

CareEvolve, the leader in outreach connectivity, is an internet based solution that will provide your laboratory with the ability to receive clean orders and deliver clinical results to outreach, affiliated or contracted providers.

CareEvolve functions:

- Order Entry for laboratory, pathology or radiology tests and procedures
- Results delivery in text or image based reports
- Cumulative reporting over global or specific data
- Trending and graphing of results
- Standing orders, saved orders or patient service center ordering functionality
- Specialized nursing home module
- Splitting of orders based on business rules, handling instructions or insurance contracts
- Secure messaging, supply ordering and forwarding of reports
- Alerts reporting to email, pagers, cell phones or PDAs
- National and Local Coverage Decisions, Medical Necessity Verification
- ABN, requisition and manifest generation
- And many more...

Middleware

I enjoyed your article, "Smooth Operator in the Lab: Middleware" (February 2006, page 1) but wanted to raise several points not addressed in the piece.

First, the article noted that middleware is offered by both instrument/automation vendors and "pure middleware" vendors, but didn't suggest which option was preferable. In my experience, middleware from instrumentation/automation vendors tends to be a better choice, primarily because satisfactory performance is guaranteed—that is, backed by an instrument/automation vendor warranty.

Keep in mind that the primary goal with middleware is to improve the efficiency of lab operations by adding functionality not readily available on legacy laboratory information systems. You will get far more efficiency—performance-wise and financially—from your investment in instrumentation and automation if you take the approach we did at Oklahoma University Medical Center: a totally integrated solution provided by essentially one major vendor with an established track record in the field.

The middleware we acquired was developed to conform to the specifications of our instruments and automation system and to optimize their performance. This approach provided an excellent fit

from the standpoint of functionality and flexibility, in my view.

Another reason for this approach is user-friendliness. Our instruments, automation system, and middleware all have the same technologist user interface, so these different middleware applications all look and feel like one application to the user. This, too, contributes greatly to work efficiency at our institution.

Finally, our middleware has valuable features that are essential—in particular, critical value alerts and exceptional data event alerts. The former signals technologists that a critical value has occurred, with brightly colored pop-up screens. This system can then communicate the protocol to be followed, including contact information for the proper clinician to be notified. It even provides a log so the technologist can enter the time the message was delivered and the name of the person who received it. Timely critical values reporting is highly valued by JCAHO, as detailed in its National Patient Safety Goals. JCAHO doesn't specify middleware as the preferred response to that challenge, but it's hard to imagine a better one.

As for exceptional data events, these occur so infrequently in labs that they rarely get handled well. Our middleware helps correct this problem by, again, providing management-defined protocols to be followed for each discrete event type. Thus, all problems get handled by technologists consistently—between shifts, on weekends, and even on holidays.

Lab-link software

continued from page 12

They also provide ease of access and ease of use, so physicians can focus on patients.

Even though electronic medical records have been around for a number of years, fewer than 17 percent of institutions have adopted them, according to government data. It is more likely that widespread adoption of EMRs is linked with connectivity to ancillary services, such as clinical labs and radiology. The majority of EMRs today have client/server architecture and were not designed to work with connectivity to ancillary services that physi-

cians require. The current EMR architecture from most vendors is too restrictive from an interfacing perspective. EMR vendors need to improve connectivity to POLLS and information from ancillary services. This will make EMRs more useful to physicians and increase the rate at which they are adopted.

POLL software vendors need to expand their focus to more than just lab data to survive and grow. They need to consider such areas as radiology, medications, and inpatient data to meet the emerging needs of their clients. Some POLL vendors may even want to consider online EMRs as the future direction for their products.

❖ **Curt Johnson**, vice president of sales and marketing, Orchard Software, Carmel, Ind.:

Johnson

POLL software was primarily developed to provide an easy add-on, Web-based connectivity solution for legacy laboratory systems. Today, legacy systems increasingly are being replaced with laboratory systems that provide remote Web access. However, the advancement of the electronic medical record changes the landscape because lab results are being delivered and stored in the EMR—

the new provider interface to all patient data. How electronic medical record systems influence the use of the POLL is up to the EMR companies and is based on the type of Internet-based solutions they offer.

The EMR system is the compiling and filing tool for all of a patient's medical and demographic information. It obviously makes the most sense for providers to have remote access to one system containing all information for a patient—from lab results, to prescriptions, to treatment notes.

As the number of EMR vendors offering remote, Web-based access solutions continues to grow, the de-

The Most Trusted Name In Lab Outreach Connectivity

Letters

continued from page 12

Our lab's goal at Oklahoma University Medical Center is a continuous, real-time flow of information from the vein of the patient to the brain of the physician. That means no batch processing to slow the testing process at any stage, from the physician order all the way to the real-time reporting of results. Indeed, we now process samples so smoothly and quickly that tests only rarely get ordered as stats. Without our instruments, automation, and middleware working in the well-orchestrated manner they do, that level of performance would be virtually impossible.

Kenneth E. Blick, PhD, ABCC, FACB

Articles as ads

I usually enjoy the articles in CAP TODAY, finding them informative and useful. However, some of the articles are nothing more than advertisements for particular businesses. The March 2006 issue was particularly annoying. The article “Owning, Rather Than Buying, Reference Lab Services” was excessively positive about Warde Medical Laboratory, and at the end of the article a traditional advertisement for the same company was juxtaposed!

I would appreciate a disclosure at the beginning of such articles that a financial connection exists between the writer, publication, and subject of the article.

Frederick E. Dennstedt, MD
Parrish Medical Center
Titusville, Fla.

■ I was sorry to learn that you considered the article little more than an advertisement for Warde Medical Laboratory and that it appeared that the writer, CAP TODAY, and Warde had a financial connection. I can

continued on page 16

Lab-link software

continued from page 14

mand for traditional POLL solutions may decline. However, as health care networks become more complex and increasingly integrate disparate systems, POLL vendors may find a niche in linking these disparate systems and delivering data remotely.

CAP TODAY: What are the most common connectivity issues a lab faces when installing POLL software, and how does it avoid or overcome those issues?

❖ **Curt Johnson** (*Orchard Software*): The first and most important issue a lab should address is

the POLL interface to the laboratory information system. Each POLL and LIS combination interfaces differently, and it is important that the lab understand the data flow—what data flows and how it flows—and the limitations of each combination. The lab should ask about interface costs and timing and keep in mind that both the POLL and LIS vendor will have interface charges and schedules to consider.

After working through interfacing issues, consider your network topography because the lab portal selected will determine the specifications needed for running the POLL on your network. Many networking

issues, both internal and external, surround the set-up, maintenance, and performance of a POLL. The lab must consider such factors as housing its Web site, bandwidth, Internet service providers, security, and secure sockets layer (SSL) certificates. Work closely with your Internet service provider and POLL vendor to determine what is best for your situation.

Finally, check that the end user has sufficient hardware and Internet access to ensure that the POLL application performs adequately.

❖ **Rob Atlas** (*Atlas Medical Software*): To us, connectivity means

seamless integration that achieves efficient workflow between the POLL system and the LIS/anatomic pathology and other systems, such as the billing system, hospital information system, and electronic medical record/patient management system. Each scenario presents its own complexities. Perhaps the most common connectivity issue labs face is a failure to identify these complexities and to seek comprehensive solutions that can deliver operational value. For example, labs can and should require that 90 percent or

continued on page 18

See our physician office-lab links software profile, pages 20–35

Letters

continued from page 14

assure you no such financial connection exists in this case or in the case of any other CAP TODAY article. As editor, I assign a story to be written only if I think it will be of interest and useful to CAP TODAY's readers.

The co-tenancy concept was one that I felt met that criterion. I knew that the story of the Michigan Co-Tenancy Laboratory had been told in presentations at meetings and that the cost of reference laboratory tests is a problem for many labs. With co-tenancy a solution to a problem for some, I thought that others might benefit from learning about it. It falls into the category of business models, solutions, and other innovations laboratories might want to read about—which we consider worthwhile editorial for our magazine.

MCL-Warde decided to purchase an advertisement to accompany the editorial coverage after I decided to publish the article and accompanying sidebar about Hurley Medical Center. I did not, I assure you, decide to publish an article about MCL-Warde because they decided to purchase an ad, though I realize it could appear that way because of where the ad was placed. Fact is, advertisers like to publish their ads in issues that contain editorial related to their tests and instruments (and some request placement near the related editorial, a request we may think is unwise but grant when we can). But in every case in CAP TODAY, it's the advertiser making its decision based on it being informed about related editorial, not the editor making her decision based on what company is buying ad space.

I was pleased to hear that you generally do find our articles informative and useful. That is what I aim for with every story, though I clearly missed my target in this case with at least one reader (and possibly others).

The lowdown on choosing a lab-link vendor

Raymond D. Aller, MD

Laboratories in the market for a physician office-lab link product must decide whether to use the POLL features offered by their laboratory information systems vendor or purchase POLL software from a third-party supplier and interface it to their LIS. At first blush, this would appear clear-cut. It must be easier and less expensive to go with your LIS vendor because you don't have to pay for an interface, and maintenance must be easier since you are dealing with the same architecture, right? Not necessarily.

Consider that many laboratories choose to contract for third-party POLL software, even though it may be more expensive, rather than select the product offered by their primary LIS vendor. Why? Because you often get what you pay for—a cheaper product may lack some of the functionality you need to serve your clients. An LIS or comprehensive hospital information systems vendor may not be able to give as much attention to the functionality of its POLL component as would a dedicated POLL vendor. Dedicated POLL vendors obviously focus all of their attention on POLL functionality and building robust interfaces not only to LISs but to many different physician office management systems.

Furthermore, some LIS vendors have purchased or licensed their POLL product (with a completely different software design) from a third party—such as another vendor or an organization that wrote its own system—so you would be building and maintaining architecture developed completely independently of the LIS.

But just as there are worthwhile third-party POLL products, there are excellent LIS vendor-based products, a number of which are included in the accompanying survey. To make sure you pick the vendor that best meets your needs, investigate whether your pre-

ferred vendor is investing the necessary resources and attention in producing and maintaining a leading-edge product. Speak with several laboratory users of the system you are considering. This will help you understand the strengths and weaknesses of the company. Remember, you're not only selecting a product, you're picking a long-term business partner.

Ask the vendors of the products you are evaluating to provide you with a complete user list. If they decline, are they trying to hide disgruntled users from you? Do they think you will sign up anyway? Are their corporate policies out of step with the clinical software field they are attempting to serve? Don't sign on the dotted line unless you believe the vendor is being completely honest and open.

Look at the vendor's history of products and service as well. Has the vendor offered POLL products in the past and dropped them? There is a difference between the evolution of one product through several generations versus a series of completely disparate products which are launched, inadequately supported, and then withdrawn and abandoned.

As you shop for POLL software, be aware that connections between POLLs and physician practice management systems provide multiple benefits, and they are also one of the most problematic aspects of such systems. The technical aspects of such connections are straightforward. But because some vendors of practice management systems will not assign any priority to this capability, such an interface cannot be made. This has led companies such as Hilgraev and Boston Software to offer a variety of noninvasive interfacing techniques. These techniques make it possible to obtain the data from the physician office practice management system, or in some cases to send data to a physician's electronic medical record, without changing the programming of that system. Such techniques were used in the 1980s and 1990s to increase the

functionality and accuracy of legacy LISs.

Keep in mind as well that too many "experts" in the laboratory informatics field focus on a particular technological tool rather than on the lab's larger business problems. For example, some experts have asserted that all connectivity between the physician's office practice and the host laboratory must be through Web page access. This overlooks the niche for thick-client-based systems, which continue to play a pivotal role in connectivity in certain environments.

The everything-must-be-Web-based dogma also misses the interesting direction being pursued by Mitem's Blue Iris Connect product. Rather than provide physician office staff with a Web-based tool for ordering and managing laboratory orders and results, the Connect approach depends entirely on order entry, result reporting, and other functionality within the electronic medical record system in the physician's office. Mitem then builds an interface, using Connect as the connectivity/interface engine tool, directly from the EMR to the host laboratory's LIS. Other vendors have provided similar functionality in the past, but Mitem is the first company we know of to position this as a distinct product and to do away with Web-page functionality in the doctor's office.

As you peruse the 20 POLL products from 19 vendors featured on the following survey pages, note that several of the vendors, including Axolotl, Fletcher Flora, Labtest, Orchard, and Sysmex, have moved away from dependence on a single proprietary Web browser to supporting a variety of products, such as Netscape and Firefox. We applaud them for doing so, as it will allow their laboratory clients to connect to physicians' offices in which technical support staff have chosen to avoid the security and other issues inherent in the commonly used browser.

Dr. Aller is director of bioterrorism preparedness and response for Los Angeles County Public Health Acute Communicable Diseases. He can be reached at raller@ladhs.org.

Lab-link software

continued from page 16

more of their outreach orders be sent to the LIS electronically. HL7 provides a common format for achieving the basics, so now it is easier to synchronize test catalogs,

insurance providers, account IDs, and physician records. However, most hospital outreach programs continue to manually register patients into their HIS and financial systems, propagating workflow bottlenecks and sources of error.

EMR connectivity presents similar

challenges. Clients can and should require their vendors to support a level of integration that delivers operational returns.

✦ **Cory P. Fishkin** (*CareEvolve.com*): Most installations go quite smoothly, both during the interface/quality assurance phase as well as dur-

ing training and implementation at physician offices and clinics. The issues that occasionally arise are generally related to HL7 interfaces and costs or time involved working with LIS vendors. For example, a hospital will discover that microbiology or pathology results are not being sent through an interface. On the order entry side, it is possible that an LIS cannot accept an inbound HL7 order message without a registration number from the HIS.

Vendors should hold detailed interface specification reviews with the hospital's interface group and may want to include the LIS and HIS vendor. This flushes out any questions upfront and makes for a smooth implementation down the road.

✦ **Ravi Sharma** (*4Medica*): The most common technical issues labs face in connecting to POLLs, or for that matter, any solution, is the availability of HL7 interface capability. Another issue that sometimes arises is the requirement for pre-registration and a medical record number to be included on the requisition before it is submitted to the LIS.

Some labs are increasing their level of automation for receiving and processing samples, which requires that physician offices generate container ID labels. However, LIS companies sometimes make it difficult for labs to interface this capability with POLLs. □

as you like it

IMPAC's clinical laboratory information system meets the needs of physician office laboratories faced with the challenge of simplifying billing and charge accrual.

IntelliLab® not only maximizes revenue by eliminating lost charges, but it also increases operational efficiency across multiple sites and helps ensure compliance with all regulatory requirements.

National commercial labs that use POLL package	—	BioReference Laboratories, Renal Care Group, RenaLab, others
Average time to install, build files, train office staff in a typical PO	1.5 hours	< 1 hour
LIS, HIS, and other interfaces	Siemens, McKesson, Cerner, Misys, others	GE, Cerner, CoPath, CPSI, McKesson, Meditech, Misys, Siemens, SCC, homegrown systems, others
Software modifications or modules required on host LIS to interface?	no	yes (results export module for HL7 results reporting, import order-entry module for HL7 orders)
POPMS*** used to transfer patient demographics or billing info. to POLL system	Medical Manager, Athena Health, Epic	A4 Health Systems, GE, IDX, Lytec, Medic, Medical Manager, MediSoft, Misys, others
How demographics or billing information is transferred from POPMS at PO or clinic to POLL system	daily update of demographics, more frequent automatic update of all demographics that have changed, POLL provides patient ID to POPMS and POPMS replies in real-time	one-time batch download/file transfer, daily update of demographics, more frequent update of all demographics that have changed, POLL provides patient ID to POPMS and POPMS replies in real-time, others
External software tools or vendors used to transfer data from POPMS to POLL system	HL7, Axolotl software	Hilgraeve, Boston Software
Test directory stored on PO system?	no	yes (thick client only)
How results are returned to PO	individually segmented fields	block of text, PDF, individually segmented fields
Data interface standards supported	HL7	ASTM 1238, HL7, ANSI X12, XML, custom when required
System supports LOINC for identifying lab result database elements?	yes	yes
System architecture or functionality	standard Web browsers	thick client, PC, while not connected to lab host; standard Web browser (Internet Explorer)
Patient order and result database maintained on local PC?	no	no
• Software displays results and allows orders to be entered in an offline mode?	no	no
Online connections between PO and central or host system	dial-up modem to private phone No., leased line, VPN, public Internet connection	public Internet connection
Complete ASP solution for POLL software?/Method of charging for ASP service	yes/fixed monthly fee	yes/charge lab physician license fees based on No. of physicians who use system
Features (listed as a percentage of live installs or whether or not it's available)		
• Order entry		
- Medicare compliance checking using carrier-specific rules	installed	85%
- Advanced beneficiary notice printed if medical necessity criteria not met	installed	85%
- Local medical review policies can be viewed	installed	85%
- Automatic routing of an order to different labs according to payer rules	installed	installed
- Printing of lab's requisitions	installed	85%
- Printing of requisitions for other lab providers	installed	installed
- Duplicate order checking	installed	85%
- Physician office-specific panels	installed	installed
• Electronic order entry (from PO to host)	installed	65%
- Transfer of patient demographics or insurance	installed	65%
- Automatic handling of scheduled or standing orders	not available	85%
- Automatic routing of orders to hospital or commercial labs depending on payer rules	not available	installed
• Bar-code collection label printing	available but not installed	85%
• Two-dimensional bar code on printed requisition	available but not installed	31%
• Software adapted for use in phlebotomy or collection stations	available but not installed	85%
• Result receipt		
- Stored as a block of text	not available	15%
- All items (result, reference range, units) stored as individual data elements	installed	95%
- Automatic parsing of report pages to extract results	not available	5%
- Inquiry mode that allows PO to check status of specimens with host	not available	installed
• Reporting		
- In exact format received from host lab	not available	100%
- Cumulative	installed	100%
- Integration of host and PO lab results	installed	available but not installed
- Display of new results for patient and/or clinic	installed	100%
- Remote access available to on-call physicians	installed	100%
- Unattended printing of reports	installed	100%
- Display current report with historical data on same screen	installed	not available
- Graph historical results with current results for trend analysis	installed	100%
• Physician can electronically sign reports to confirm review	installed	100%
• Physician can compose and send secure electronic messages to patients	available but not installed	100%
• User-defined rule-based system and alerts in PO module	installed	100%
• Electronic transfer of data to another PO	installed	100%
- E-mail/encrypted e-mail	not available/installed	not available/installed
- Web reference or pointer to Web site	not available	installed
- Fax	installed	not available
• PO orders supplies from host lab	available but not installed	10%
- Specimen pickup or courier requests to host lab	not available	available in Dec. 2006
• Financial		
- Billing, collections, accounts receivable	available but not installed	not available
- Electronic claims transfer/interfaces to billing systems	available but not installed	not available/30%
• Electronic medical record interface	installed	80%
• Interfaces to PO lab instruments	not available	available but not installed
• Entry of PO lab results with edit checks	installed	available in Dec. 2006
System priced on a cost-per-transaction basis?	no	no
One-time/initial charges	—	~\$45k-\$85k (based on No. of interfaces requested)
Monthly/subscription fees	—	~\$2.5k-\$4.5k (based on size of outreach program)
Basis for increasing fees as POs are added	based on No. of physicians of record	based on No. of physicians of record
Situations where fees increase with additional services	n/a	—
Distinguishing product features (supplied by vendor)	<ul style="list-style-type: none"> • national standards • browser based • interface specialists can connect POLL to any system 	<ul style="list-style-type: none"> • owned by a lab that uses the system on its own customers • the third order-entry system BioReference Laboratories has built over its 25-year history • designed with a 30-min. training time goal

Tabulation does not represent an endorsement by the College of American Pathologists

Name of POLL software/system	Misys Encompass	Blue Iris eLaborate
First/most recent installation of software or system	—/Feb. 2005	1990/2006
No. of host or central labs using software clinically	8	17
• No. of host labs that electronically transfer orders from PO* to LIS	8	8
No. of satellite locations installed/non-U.S. host installations	500-800/0	750+/0
No. of contracts for host labs signed since March 1, 2005	8	4
Staff to develop-install & support host lab-install & support PO-other** in entire firm/in POLL software division	400-450-0-175/11-4-0-0	15-15-8-8/5-5-3
National commercial labs that use POLL package	TriCore	Focus Diagnostics
Average time to install, build files, train office staff in a typical PO	—	2 hours
LIS, HIS, and other interfaces	Misys	Meditech, Cerner, SCC, Misys, GE, Eclipsys, others
Software modifications or modules required on host LIS to interface?	no	no
POPMS*** used to transfer patient demographics or billing info. to POLL system	Misys Tiger, Misys Vision, Centricity, Logician, GE, Medical Manager, Compusystems, MediSoft, NueMD, MicroMD	Misys, MARS, RenalSoft, GE
How demographics or billing information is transferred from POPMS at PO or clinic to POLL system	POLL provides patient ID to POPMS and POPMS replies in real-time	one-time batch download/file transfer, daily update of demographics, more frequent automatic update of all demographics that have changed, others
External software tools or vendors used to transfer data from POPMS to POLL system	Hilgraeve	none
Test directory stored on PO system?	no	no
How results are returned to PO	—	block of text, PDF, individually segmented fields
Data interface standards supported	HL7, ANSI X12	HL7, XML, custom when required
System supports LOINC for identifying lab result database elements?	yes	yes
System architecture or functionality	standard Web browser (Internet Explorer 5.5 sp2 and higher)	standard Web browser (Internet Explorer)
Patient order and result database maintained on local PC?	no	no
• Software displays results and allows orders to be entered in an offline mode?	—	no
Online connections between PO and central or host system	public Internet connection	public Internet connection
Complete ASP solution for POLL software?/Method of charging for ASP service	no	yes/fixed monthly fee
Features (listed as a percentage of live installs or whether or not it's available)		
• Order entry		
- Medicare compliance checking using carrier-specific rules	100%	75%
- Advanced beneficiary notice printed if medical necessity criteria not met	100%	75%
- Local medical review policies can be viewed	not available	75%
- Automatic routing of an order to different labs according to payer rules	not available	75%
- Printing of lab's requisitions	100%	75%
- Printing of requisitions for other lab providers	not available	30%
- Duplicate order checking	100%	50%
- Physician office-specific panels	100%	50%
• Electronic order entry (from PO to host)	100%	50%
- Transfer of patient demographics or insurance	100%	50%
- Automatic handling of scheduled or standing orders	100%	20%
- Automatic routing of orders to hospital or commercial labs depending on payer rules	not available	50%
