

Fig. 3. Fungal histology from the pseudocavitary lesion in the abdomen showing extensive infiltration of the tissues by fungal hyphae. **A)** PAS-stained section showing classic ribbon-like, aseptate hyphae of variable width. **B)** GMS-stained section showing lack of silver reactivity in the fungal hypha. **C)** PAS-stained section showing clear septa formation. **D)** PAS-stained section showing near 45-degree angle branching.
