

Agilent releases on-deck thermal cycler for Bravo NGS platform

March 2023—Agilent Technologies released an on-deck thermal cycler that integrates with the company's Bravo NGS automated liquid handling platform. The optional accessory enables the Bravo platform to provide thermal cycling as part of an automated protocol and extends walkaway time. The setup is beneficial, the company says, for applications such as library preparation and target enrichment steps in next-generation sequencing workflows, end-point PCR, and cell-based applications.
