

Antibody and biomarker search engine update, 8/15

Visabl.com, a cloud-based antibody and biomarker search engine, announced its largest website update. The latest iteration of the Visabl website features several enhancements and improvements to the site and user interface, including a faster targeted search of biomarkers and the ability to dynamically sort and populate results as the user types. This will enable users to quickly find the antibody of choice from a selection of more than 4,000 proteins in the Visabl database. The content has been updated as well, with a database that lists more than 30,000 antibodies and biomarkers across more than 5,000 proteins, from several manufacturers worldwide. Curated lists of popular biomarkers used in anatomic pathology can be found via the VisaPath Anatomic Pathology panels.
