

## ASI, Biocare partnership, 2/14

February 2014—Applied Spectral Imaging (ASI) and Biocare Medical signed a partnership agreement in which Biocare will distribute ASI's IHC and CISH imaging and analysis solution, GenASIs Pathology, in the United States. The agreement brings to cytopathology and anatomic pathology laboratories a fully integrated solution that improves quality while providing workflow efficiencies.

From slide preparation through analysis and results reporting, the combined solution enables faster turnaround time while providing accurate, reproducible, and standardized results. Laboratories benefit from computer-aided scoring, counting and ratio analysis, and Allred, H-score, and M-score analysis automation. The system provides standardized results for stains such as ER, PR, and HER2 (cErbB2). Analysis results and automatically generated reports are managed in the solution's built-in information management system, which can be linked to a laboratory information system.
