

ASI, WaveSense to provide imaging and analysis instrument and cell enrichment solution, 7/13:105

Applied Spectral Imaging and WaveSense have entered into an agreement in which both companies will engage in combined sales and marketing of ASI's GenASIs imaging and analysis instrument and WaveSense's EpiSep cell recovery and enrichment solution. The combined solution provides an integrated cell capturing solution and computerized instrument to detect, image, and analyze the captured cells.

ASI and WaveSense have confirmed the effectiveness of the combined solution to perform semi-automated FISH analysis of paramagnetic labeled target cells. Target cells may be retrieved, enriched, imaged, and analyzed in urine, bone marrow, blood, needle aspiration, abdominal ascites, lymph node, culture, and pleural effusion specimens.
