

Automated instrument analytics, 11/14

November 2014—Abbott has introduced an automated performance-monitoring subscription, mView, for its m2000 molecular diagnostics system. mView is a Web-based service designed to automate data analysis and help laboratories reduce the number of manually generated reports.

AbbottLink, the company's remote diagnostics agent, provides access to the instrument analytics and is required before access to an mView subscription. mView customers will receive training via WebEx to navigate the website and create reports.

Features include a dashboard for quick reference, several configurable reports, as well as monthly archived reports that monitor operational efficiencies, including calibration frequency, tests over time, run efficiency, and composition. Data are readily available and validated from m2000rt software screens or results logs. Abbott offers middleware solutions that allow access to patient test results.
