

BD FACSymphony A1 Cell Analyzer

October 2021—BD launched the BD FACSymphony A1 Cell Analyzer, a fluorescence-activated cell analyzer that offers advanced research capabilities in a benchtop design. Fluorescence-activated cell sorter (FACS) technology enables precise isolation of selected single cells from complex samples.

The analyzer features BD FACSymphony instrument technology with the flexibility to meet a broad spectrum of research needs from small particle research to 16-color immunophenotyping, along with industry-standard BD FACSDiva software for streamlined workflows from system setup to data acquisition and analysis. Researchers can perform independent detection of large and small particles, such as extracellular vesicles on a single instrument, using the optional BD Small Particle Detector.
