

Beckman launches tabletop DxH 560 AL hematology analyzer

Jan. 29, 2021—[Beckman Coulter](#) launched the DxH 560 AL, a tabletop analyzer geared to reduce the time and resource constraints faced by small to mid-sized laboratories. Features of the analyzer include auto-loading, closed-tube aspiration, and walkaway capabilities. The DxH 560 AL uses a 17 µL sample, one of the smallest sample volumes on the market, the company says. Users can continually load up to 50 samples and results are delivered in 60 seconds or less.

“With proven performance and low cost to operate, the DxH 560 AL includes the analytical strengths and data management capabilities of high-throughput analyzers in a small footprint,” Peter Soltani, PhD, senior VP and general manager of hematology at Beckman Coulter, said in a press release. “The industry-leading functionality and auto-load capabilities of the DxH 560 AL enable smaller labs to reap the same efficiency and productivity benefits as their larger counterparts without blowing the budget.”

The analyzer provides privacy and security features including customizable user login, paperless data management, and fully traceable automated timeouts that guard patient electronic personal health information.
