

Bio-Rad quality control for urinalysis testing

April 2019—Bio-Rad Laboratories announced the launch of Quantify Advance Control, an independent quality control used to monitor the precision of laboratory urinalysis test procedures. The control contains human urine solution and offers 31 days of open vial stability for all analytes, including ketones, at room temperature. The Unity interlaboratory program and Unity QC data management solutions, designed to improve the effectiveness of the laboratory's statistical process control, are available for use with Quantify Advance.
