

Biological safety cabinets, 11/13

Air Science's Purair Bio safety cabinet is designed to protect individuals, the environment, and products from a variety of biological particulates, serving as the primary barrier in life science research and experimentation. As a class II type A2 biosafety cabinet, the Purair Bio minimizes and contains biosafety level one to three agents, maintaining negative pressure inside the cabinet during operation to prevent contaminants from escaping the work area.

HEPA filtration scours 70 percent of incoming room air to protect the products, while the remaining 30 percent of the exhausted air is filtered by a second HEPA filter. Purair Bio cabinets provide ample workspace with environmentally sound operation and low energy consumption.
