

Body fluids kit

December 2018—LGC Maine Standards has released its Validate Body Fluids kit, 205bf. The kit, in a simulated body fluid matrix, will assist in the documentation of linearity, calibration verification, and verification of the reportable range for albumin, amylase, cholesterol, creatinine, glucose, lactate, lactate dehydrogenase, total protein 2, triglycerides, and urea nitrogen. Validate Body Fluids kits are liquid, ready to use, and offer five distinct concentrations to establish the reportable range.
