

***Bordetella pertussis* antigens for IVD use**

March 2018—Binding Site's Immunologicals Group has added three *Bordetella pertussis* (VZV) antigens to its offering of products for in vitro diagnostic manufacturing and research applications. The *Bordetella pertussis* FHA, *Bordetella pertussis* Toxin PT, and *Bordetella pertussis* Whole-Cell Antigens have been designed for use as integral components within solid phase enzyme immunoassay test procedures.

The company says its *Bordetella pertussis* antigens exhibit exceptional purity levels as a result of chromatography techniques and demonstrate exceptional lot-to-lot consistencies while displaying the highest degrees of activity and specificity. The antigens have a shelf-life stability of 10 years from manufacturing date and are offered in a 1.0-mg filled vial with larger, bulk configurations also available.
