

CE marking for Ventana system, 11/14

November 2014—Ventana Medical Systems announced that its Ventana System for Primary Diagnosis has been CE marked in the European Union for routine pathology, including for primary diagnosis with human tissue specimens. The system, which consists of the Ventana Virtuoso software coupled with either the Ventana iScan Coreo or the iScan HT slide scanner, provides automated digital slide creation, case management, and computer viewing of human tissue specimens. The CE mark for its application in routine pathology expands diagnostic options for the hematoxylin and eosin test.
