Cloud pathology system, 2/13:111

Smart Imaging Technologies' Simagis Live Web Pathology Platform version 4.0, launched last month, makes the transition to digital pathology simple and affordable. With Simagis cloud software, pathologists can connect scanners to a private cloud server and start collaborating.

The system automatically uploads slides from local computers and aggregates the slides to cases, keeping track of images, documents, and comments. Users can share slides, invite others to their workspace, or include live images in PDF reports. Live markers provide instant measurements, and a zero-footprint Web viewer enables instant access to images from any browser, including those on mobile devices.

By adding attributes to slides and cases, users can create knowledge libraries from slide collections and use a variety of interactive applications from Apple's App Store to run image analysis, including IHC bookmarkers and CBCs.

Simagis works with all major scanners. Users without scanners can select a scanning service provider from a list and have slides delivered to their workspaces. Find live examples of digital slides at http://host.simagis.com/live/guest/.
