

## ELISA test kit for systemic sclerosis, 10/14

October 2014—Protagen launched its first ELISA research-use test kit, the ADxSSc Multilisa, for systemic sclerosis. The ADxSSc Multilisa assay employs the company's proprietary biomarker development platform to enable the simultaneous, qualitative, in vitro detection of antibodies against domains of Scl-70 (topoisomerase I), CENP-B, KDM6B, and BICD2, within human serum or plasma. The assay is in further clinical testing to build a diagnostic claim for early disease detection or stratification.
