

Fabric Genomics expanded somatic cancer solution, 3/18

March 2018—Fabric Genomics announced its expanded somatic cancer solution at the 2017 Association for Molecular Pathology annual meeting in November. The solution provides genomic analysis and clinical reporting to clinical labs and enables therapy matching for cancer patients, giving clinicians targeted treatment choices. It offers one integrated platform for the interpretation of somatic cancer panels, hereditary panels, and whole genomes.

The expanded capabilities include variant calling, annotation from cancer-specific databases, clinical curation from multiple providers, and the ability to create physician-ready clinical reports quickly.
