

FDA-cleared test to detect *Campylobacter*, 4/18

April 2018—Techlab has received FDA clearance for the Campylobacter Quik Chek and the Campylobacter Chek tests to aid the diagnosis of campylobacteriosis. The Campylobacter Quik Chek test is a rapid diagnostic test that detects *Campylobacter jejuni* and *Campylobacter coli* in less than 30 minutes. The Campylobacter Chek test is a 96-well plate format for laboratories testing large numbers of specimens and can be used with or without automation. The tests have accuracies that surpass culture and have the highest positive predictive values among currently available *Campylobacter* immunoassays, the company says.
