

## Fecal occult blood test, 6/13:96

Sekisui Diagnostics' OSOM rapid immunochemical fecal occult blood test detects hemoglobin in stool samples as an aid in the early detection of colorectal cancer.

The OSOM test provides sample stability: a unique "dry-sample" collection card; value: two patient sample collections on one collection card allow compliance with screening guidelines, using only one test cassette; and a comprehensive physician and patient support Web site ([www.osomifobt.com](http://www.osomifobt.com)).
