February 2020—Genomenon announced a partnership with Sophia Genetics that includes incorporating Genomenon’s Mastermind genomic search engine into the Sophia platform and the Alamut suite.

The Alamut suite powered by Sophia is a decision-support software designed to explore and investigate variations of the human genome. With the addition of Mastermind, users of both technologies will be able to access the genomic evidence associated with human variants, shortening the search time required to interpret a variant and assess its pathogenicity. Mastermind has indexed more than 7 million full text articles and 600,000 supplemental data sets and covers more than 5.7 million variants found in medical literature.
