

Handheld pipette

May 2014—Eppendorf's Repeater M4 is a handheld pipette that works with nine sizes of the company's Combitips advanced. A built-in sensor detects the Combitip and displays the tip volume; there is also an integral step counter that shows the number of steps executed, which can be useful in case of an interruption during dispensing. One-handed operation for contact-free tip ejection avoids the risk of contamination.

The Repeater M4 dispenses 1 μ L to 10 mL, and since there are 20 volume settings for each of the nine Combitips, there are a maximum of 100 dispensing actions, making it applicable for 96-well plates.
