

Hematology analyzer, 9/13:76 (AACC)

Beckman Coulter's UniCel DxH 600 Coulter cellular analysis system is for mid- to high-volume laboratories. The benchtop hematology analyzer—with advanced software—provides laboratories with exceptional quality results, improved first-pass accuracy, and automatic rerun and reflex testing, thereby reducing overall manual review rates and processes.

The UniCel DxH 600 is equipped with software that saves time by allowing labs to partially release patient results manually or automatically via decision rules, enables users to create and edit decision rules during instrument operation, and offers predefined decision rules using Cell Population Data.

The software also can track workload by the day, hour, and test and provide automatic notification of stat samples that have not been processed or released within an expected time frame.

Cell Population Data is for research use only.
