July 2020—Hemex Health (Portland, Ore.) launched the company's Gazelle diagnostic platform, which integrates artificial intelligence with automated, miniaturized electrophoresis and internal and cloud-based data storage. The battery-operated platform uses an Android cell-phone charger and does not require a cold chain.

The Gazelle features an Hb variant test that automatically identifies and quantifies sickle cell and other Hb variants from a small blood sample in eight minutes. The test is CE marked and has regulatory approval in India and Ghana, with other country registrations pending.

The platform also includes a CE-marked test for malaria that delivers results in about one minute and is highly sensitive for *Plasmodium vivax* infections.

The Gazelle will be distributed exclusively in India and other key regions by Bio-Rad Laboratories.
