Beckman Coulter Life Sciences has added to its flow cytometry portfolio 14 new human monoclonal antibodies from Trillium Diagnostics. The analyte-specific reagents are highly specific, convenient, and flexible. Also offered is a new cell permeabilization reagent.

The new monoclonals include human anti-hemoglobin F, which recognizes fetal hemoglobin molecules; CD163 markers for anti-inflammatory signal and disease research; and CD64 markers, which react with Fc gamma 1 receptors.

Rounding out the line is a monoclonal for myeloid nuclear differentiation antigen. All antibodies are available unconjugated or conjugated to a selection of fluorochromes.
