

IgG subclass antibodies

June 2018—Binding Site's Immunologicals Group announced the availability of affinity-purified, unconjugated, anti-human antibodies to the IgG subclasses, including IgG1, IgG2, IgG3, and IgG4, for IVD research use in solid phase enzyme immunoassay based test methods, especially ELISAs, and other potential testing applications.

The company also offers biological materials from a variety of infectious disease state conditions, including those with IgM and IgG antibodies to CMV, HSV-1, HSV-2, measles, mumps, rubella, and toxoplasma. Available serum and plasma materials can be made as individual test samples for research and other applications, or in large, bulk formats for use in the manufacturing of calibration or quality control materials. Pooled serum and plasma matrices are available as well.
