

Illumina launches Connected Insights software

May 2023—Illumina announced the release of Connected Insights, a cloud-based software for tertiary analysis of clinical next-generation sequencing data. The software enables labs to connect to a network of more than 45 third-party knowledge sources that provide digital directories for precision oncology, illustrating connections between cancer variants and therapies, citing evidence, and aiding analysis of complex cancer genomic profiles. It can also link users to regional guidelines, clinical trial databases, drug labels, and a private collection of data from previous cases within a customer's laboratory. As the use of clinical NGS testing grows, Illumina says it will expand the software's capabilities across other disease areas.

Connected Insights is commercially available in a limited number of countries and is undergoing beta testing in the United States.
