

## Imaging and telepathology workstation, 12/14

**December 2014—The PathScope 2 microscope imaging system** from SPOT Imaging Solutions is designed to save pathologists up to two minutes per slide by streamlining routine slide examination. One click of the HistoSnap button captures the image during slide examination and imprints the image with the case number and reference mark, and then archives it to the laboratory information system, file server, or cloud storage. Interactive telepathology consultations are a standard part of the system, providing a single-click connection with fully interactive image, voice, cursor, and annotation for the host and attendees. Interactive meetings are documented to the case file with a click of a button.
