Intelligent lab automation solution, 9/13

Roche's Cobas 8100 automated workflow series is an advanced system designed to automate many routine tasks to help diagnostic laboratories increase efficiency, reduce expenses, and maximize patient safety.

Through intelligent robotics, the Cobas 8100 series automatically prepares blood samples for immediate testing and post-analytical processing, providing high-speed processing of up to 1,100 samples per hour. The system offers dynamic and efficient sample transport options and great flexibility, allowing labs to automate routine and stat tests. Health care professionals benefit from on-time, high-quality diagnostic results for routine and emergency tests, even at laboratory workload peaks.

The Cobas 8100 series can be added easily onto Roche's existing Cobas analyzers, and its flexible, modular design allows labs to grow over time as demand increases. Roche expects the solution to be available in the U.S. in 2015.
