

Luteinizing hormone ELISA kit

January 2015—Enzo Life Sciences introduced an LH ELISA Kit for sensitive and rapid detection of luteinizing hormone. The LH ELISA Kit can be used to quantify human LH in serum and plasma samples and tissue culture media. The assay can detect as low as 5.2 mIU/mL of luteinizing hormone, surpassing semiquantitative Western blot analysis, and produces rapid results in less than two hours with negligible reactivity to similar glycoprotein hormones.
