

Multi-sampling blood collection system, 3/13:74

Sarstedt's S-Monovette is an enclosed multiple-sampling blood collection system. All tubes are plastic and have screw caps, which minimizes the risk of breakage and aerosol formation when caps are removed. The screw caps have a thin, recessed membrane that is easy to puncture and protects users from residual blood droplets.

S-Monovette tubes connect securely to the company's Safety Needle via a three-pin locking mechanism. In addition to a fixed needle protector to cover the front needle immediately after use, the Safety Needle's small integral holder protects users from the needle's back end.

Users can manipulate the S-Monovette to perform a vacuum or gentle aspiration collection. As a result, no sample transfers are required, and winged-tip needle use is minimized.
