

Multisystem integration for LIMS, 9/15

At the AACC show 2015

MedCompGx, a division of MedComp Sciences, announced the installation and implementation of UniConnect's Precision MDx laboratory information management system for its new genetic testing lab. The system provides automation of all processes while integrating with multiple systems under one umbrella.

Precision MDx was developed for laboratory professionals seeking a focused solution for CAP- and CLIA-certified molecular laboratory operations. It can be deployed as standalone software or integrated with existing LIS and billing infrastructure. Based on the UniFlow Laboratory Process Management Platform, UniConnect specializes in rapid implementation.

A key part of the success of the partnership has been the work accomplished by Translational Software, a software-as-a-solution company that is providing the pharmacogenetic interpretive solution for MedCompGx. By integrating the patient's raw genetic data with its individual medication list, MedCompGx is using Translational Software's proprietary knowledge base to create actionable reports for ordering clinicians. These reports can be used to identify problematic drug/gene interactions.
