Vector Laboratories has added to its line of Western blot detection reagents two highly active WestVision peroxidase polymer antibody conjugates.

Designed to detect primary antibodies of mouse (WB-2000) or rabbit (WB-1000) origin, WestVision reagents provide sharp signal and low background in Western blot detection. The conjugates are based on a new method of polymerizing enzymes and attaching these polymers to antibodies, allowing a higher density of enzymes to access a target with minimal interference. The result is an excellent signal-to-noise ratio in Western blot detection.
