October 2020—Promega launched its benchtop capillary electrophoresis instrument, the Spectrum Compact CE system, developed in collaboration with Hitachi High-Tech. The integrated DNA analysis instrument enables life scientists in laboratories of all sizes to perform Sanger sequencing and fragment analysis at the bench.

The system supports applications such as microsatellite instability analysis, mixed sample analysis, forensic short tandem repeat analysis, and cell line authentication. It processes up to 32 samples in a single run and can be controlled by the integrated touchscreen or by additional software that allows access from any registered computer on the same network.

Promega offers extensive support to laboratories integrating a Spectrum Compact CE system into their workflow, including on-site instrument and software installation and operational training.
