

## qPCR-based library quantitation solution, 9/15

**New England Biolabs released the NEBNext Library Quant Kit** for Illumina, a qPCR-based solution for accurate next-generation sequencing library quantitation.

“The standards included in the kit are produced and quantitated with great accuracy. Since only four standards are required, wells are freed up for quantitating additional libraries. Finally, an easy-to-use online quant tool, NEBioCalculator, is available from NEB, rounding out this complete solution for library quantitation,” Fiona Stewart, NEBNext product marketing manager, said in a statement.

The kit includes a concentrated Library Dilution Buffer and ROX, a reference dye used for normalization with some qPCR instruments. A single extension time is required for all libraries, regardless of insert size.
