

Quality by Design-based program, 9/14

At the AACC Show 2014

September 2014—Multisorb's QbD-based Calculations through Operations program provides an effective and efficient solution for ensuring the chemical and physical stability of IVD devices through their desired shelf life. The Calculations through Operations program can be used to calculate and develop an optimized sorbent (desiccants, moisture regulators, oxygen absorbers, and volatile adsorbers) for a specific application. Multisorb's sorbent solutions are available in many formats, including Drop-In (packets and canisters), Fit-In (compressed solid forms that fit securely into an existing space in the packaging), and Built-In (thermoformed device components with sorbent incorporated into the material).
