

## Quantimetrix launches Dipper POCT

July 2018—Quantimetrix announced the launch of its Dipper POCT Single-Use Liquid Urinalysis Dipstick Control for use in a variety of testing environments, including central labs, reference labs, nursing stations, and doctors' offices.

Dipper POCT is a single-use liquid control made with a simulated human urine matrix and has a stability of three months at room temperature and three years when refrigerated, from date of manufacture. The pouch is designed to allow users to visually verify full immersion of the dipstick, minimize the risk of contamination, and reduce the volume required for testing.

Dipper POCT is available for sale in the U.S. only; current lots are value assigned for Siemens strips and analyzers only, with further value assignment to follow.
