

Remote microscopy telepathology tool, 7/13:104

MikroScan Technologies' Live-Q telepathology tool works as an add-on to the company's D2 desktop whole slide scanner, which enhances remote viewing and remote control of the device.

Keith J. Kaplan, MD, surgical pathologist and producer of the Digital Pathology Blog, recently tested the Live-Q user experience in a café over a standard typical Wi-Fi connection. He wrote in his review, "In summary, this system works on every level. It's fast, it's responsive, it's intuitive, it's high quality, and it's easy to use and delivers everything it promises."

Remote telepathology with Live-Q helps eliminate travel logistics and the typical wait time associated with the traditional pathologist-surgery room scenario. One pathologist using Live-Q can close a case in minutes.

MikroScan Live-Q integrates networked video streaming technologies that enable real-time responsiveness, for a remote user experience nearly identical to having the instrument in your own hands. The system works via secure encryption over the Internet so it can be viewed in any Web browser, including on wireless mobile devices and tablets.
