

Stabilized pepsin for cytogenetic assays, 9/13

SciGene's CytoZyme stabilized pepsin is an advanced formulation of pepsin for pretreating tissue samples in nucleic acid probe-based cytogenetic assays, including FISH.

CytoZyme is a ready-to-use solution of purified pepsin that can be stored in the refrigerator without loss of activity. It replaces dry-powder forms of pepsin that vary in activity and that can negatively affect test results.
