

Sweat collection system

October 2018—EliTechGroup Biomedical Systems released its FDA-cleared Macroduct Advanced Sweat Collection System for use in the diagnosis of cystic fibrosis. The system includes a touchscreen user interface with step-by-step graphical instructions that help standardize pilocarpine iontophoresis and sweat collection. The elliptical shape of the electrodes and Macroduct collector better fit smaller limbs, such as those of neonates and toddlers. The integrated timer monitors the 30-minute collection time, and exportable test data help verify correct performance of the tests.
