

Sysmex renews deal to distribute EasyCell, 9/13

Sysmex America has renewed its agreement to distribute Medica's EasyCell assistant for digital cell image analysis in hematology laboratories.

EasyCell uses optical pattern recognition software to automatically locate white cells on a blood smear. It digitally stores, preclassifies, and presents images for review, grouped by cell type, on an LCD display. It also presents images of red cells and platelets, enabling red cell morphology and platelet estimates. Its 30-position carousel offers walkaway operation, while a stat slide port permits immediate testing without disrupting a sample run.

Optional EasyCell remote review software allows the networking of multiple EasyCell assistant workstations, on site and in freestanding clinics and practices.
