

Telepathology solution, 4/16

Mikroscan Technologies released the SL5, a real-time telepathology and whole slide imaging solution for use in anatomic pathology applications. The inclusion of five objectives ranging in magnification from 2× to 40× permits users to look at specimens in their true magnification, preserving detail. Complete remote control of X, Y, and Z objective magnification selection and contrast adjustments is included to further enhance the solution's live capabilities. The system also contains a new Snap-Shot tool to view, capture, and store images for further image analysis or reports and a Z-Snap tool to collect and store real time through focus regions of interest such as those found in cytopathology.
