

Tissue, ID micro arrays, 3/14

March 2014—Bio SB launched the Normal Human Tissue Micro Array and the Infectious Disease Cell Line Micro Array. The NH-TMA arrays are available in 11- or 23-core configurations, allowing testing of multiple tissues on one slide, and are validated for use with more than 100 antibodies in immunohistochemistry. The ID-Array tests and validates infectious disease markers by immunohistochemical or in situ hybridization. The ID-Array is available in a nine-core or individual virus configuration and includes two areas for tissue mounting. TMAs include negative controls.
