

H&E tissue staining solution, 2/16

Roche launched the Ventana HE 600 system, its latest fully automated hematoxylin and eosin tissue staining system designed to enhance patient and technician safety and produce exceptional staining quality.

The system delivers fresh reagents on each individual slide without relying on user-supplied alcohol and deionized water, resulting in improved consistency and quality in tissue staining. The individual slide-staining technology mitigates the risk of specimen cross contamination, helping to reduce patient misdiagnosis; workflow is improved by eliminating the need to manually mix reagents and track product expiration dates. The system offers more than 400 individual staining protocols and is fully customizable.
