

## Updated interlaboratory data management program, 5/17

**May 2017**—Randox has launched Acusera 24.7 Live Online 2.0, which is faster than the previous version, has a simplified user interface, and an enhanced user experience. The biggest update to version 2, according to a company statement, is the ability to review peer data in real time, which enhances troubleshooting capabilities and allows labs to identify trends.

All reports can be generated for a user-defined data range. Reports available on Acusera 24.7 Live Online include statistical analysis, statistical metrics, audit trail reports, and the new exception report. The reports, coupled with user-friendly and easy-to-interpret charts, such as Levey-Jennings, histograms, and performance summary charts, enable rapid performance monitoring. The ability to add multiple instruments, QC lots, analytes, and events such as calibration and reagent lot changes to a single chart allows for comparative performance assessment and immediate identification of trends. The new software is capable of bi-directional communication with LIMS.
