

Urine collection tube, 9/16

September 2016—Sarstedt introduced its 3.2 mL Urine Monovette tube in a 13 mm × 75 mm configuration for smaller volume or dimensional requirements. The Urine Monovette system enables hygienic urine collection and testing without needles, adapters or cups, or transfers. The tubes are manufactured from impact-resistant, medical-grade plastics and feature secure screw caps for safe handling. After collection using a syringe technique, the plunger handle is removed to create a primary tube for transport, direct analysis, and centrifugation.

Urine Monovettes are also available in 8.5 mL and 10 mL volumes, with and without preservative, in white to protect light-sensitive analytes, with a Luer lock adapter for Foley catheters, and in bulk or individually wrapped. Each tube features graduations, lot number, and expiration date.
