

WASPLab system installation, 9/13

The CHU de Québec, a health care institution in Québec, and Copan Diagnostics announced the full installation of the WASPLab laboratory automation and digital microbiology system in Hôpital de l'Enfant-Jésus, one of the five hospitals forming the CHU de Québec.

This hospital and Copan worked together to deliver the fast, seamless solution for full laboratory automation. The installation of WASPLab's hardware took place in less than one week.

"WASPLab solution allows standardization of the planting and streaking and specimen processing, decreases risk of errors, and also lowers repetitive stress related to repeated movement for our staff," Alain Paradis, MD, chief microbiologist and infectious disease specialist for Hôpital de l'Enfant-Jésus, CHU de Québec, said in a statement.
