

Water purification system, 9/13:103

ELGA Process Water introduces the Medica Pro electrodeionization (EDI) water purification system. The system consistently produces high-purity water at economical running costs for immunochemistry and general chemistry automated clinical analyzers. ELGA's Pulse technology combined with extended intervals between sanitization reduces maintenance time.

The technology integrates EDI, which combines ion-exchange resins and ion-selective membranes, with direct current to remove ionized impurities from water.

The Medica Pro EDI is designed to fit into any lab environment and can be mounted on or under a bench.
